same thing.

the same thing.

Name

2) Consider the following code:

```
import random
tots = [0.00]*3
maxVals = [0.0]*3
mean = 100.0
stdDevs = [0.0, 20.0, 40.0]
for i in range(1000):
    for j in range(len(tots)):
        next = random.gauss(mean, stdDevs[j])
        tots[j] += next
        if next > maxVals[j]:
             maxVals[j] = next
```

2.1. What are the expected values of each element of tots at the end of the code? Hint: random.gauss(mu, sigma) returns a random value chosen from a Gaussian distribution with mean mu and standard deviation sigma. (9 points)

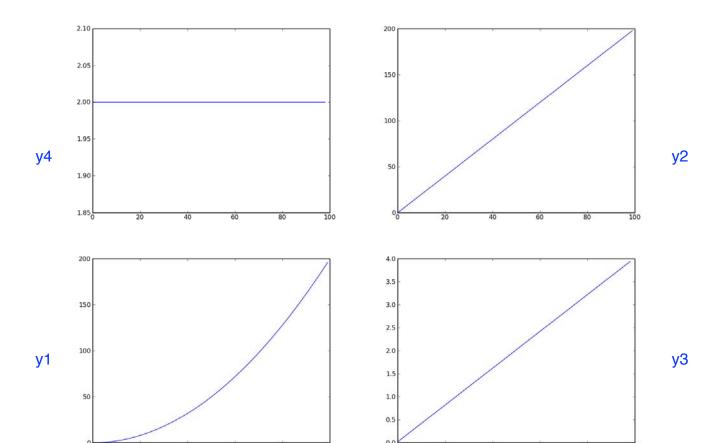

```
tots = [100k, 100k, 100k]
```

Are each of the following True or False (9 points):

- T 2.2. One would expect maxVals[0] to be less than maxVals[1].
- 7 2.3. One would expect maxVals[1] to be less than maxVals[2].
- T 2.3. If the code were run twice, the value of tots [0] would be the same each time.

3) The code produces 4 plots. Match each plot below to a figure number by writing 1, 2, 3 or 4 **on the plots**. (16 points)

```
y1, y2, y3, y4 = [], [], [], []
for i in range(100):
     y1.append((i**2)/50.0)
     y2.append(2*i)
for i in range(99):
     y3.append(y1[i+1] - y1[i])
     y4.append(y2[i+1] - y2[i])
pylab.figure(1)
pylab.plot(y1)
pylab.figure(2)
pylab.plot(y2)
pylab.figure(3)
pylab.plot(y3)
pylab.figure(4)
pylab.plot(y4)
```

Name

4) What does the following code print? (10 points)

```
class Shape(object):
    def eq (s1, s2):
       return s1.area() == s2.area()
    def lt (s1, s2):
       return s1.circum() < s2.circum()
class Rectangle(Shape):
    def init (self, h, w):
        \overline{\text{self.height}} = \text{float(h)}
        self.width = float(w)
    def circum(self):
       return 2*(self.height + self.width)
    def str (self):
        return 'Rectangle with area ' + str(self.height*self.width)
class Square(Rectangle):
    def init (self, s):
       Rectangle.__init__(self, s, s)
    def __str__(self):
       return 'Square with side ' + str(self.height)
class Circle(Shape):
    def init (self, radius):
        self.radius = float(radius)
    def circum(self):
       return 3.14159*(2*self.radius)
    def lt (self, other):
       return self.radius < other.radius
    def str (self):
        return 'Circle with diameter ' + str(2.0*self.radius)
def reorder(L):
   for e in L:
       if e < L[0]:
           L[0] = e
L = [Square(6), Rectangle(2, 3), Circle(1)]
try:
    reorder(L)
    for e in L:
       print e
except:
    for e in L:
       print e
```

done

Name

5) Write a function that uses a Monte Carlo simulation to find the probability of a run of at least 4 consecutive heads out of ten flips of a fair coin, and then returns that probability. Assume that 10,000 trials are sufficient to provide an accurate answer. You may call the function :

```
def simThrows(numFlips):
    """Simulates a sequence of numFlips coin flips, and returns True if
    the sequence contains a run of at least four consecutive
    heads and False otherwise."""
```

(19 points)

(17 points)
def sim(): #write your code below
done in the python file

6.00 Quiz 2, 2011	
	N

Name
6) If pylab.polyfit is used to fit an nth degree and an (n+1)th degree polynomial to the same data, is one guaranteed to provide a least squares fit that is at least as good as the other? If so, which and why? If not, why not? (10 points)

no, may have overfit

Name

7) Next to each item in the left column write the letter labeling the item in the right column that best matches the item in the left column. No item in the right column should be used more than once, and no box should contain more than one letter. (12 points)

	data abstraction	n		;	a) inheritance					
	merge sort			1	b) divide and conquer					
	polymorphism				c) O	(log	n)			
	hashing				d) O	9 (n)				
				(e) O	(1)				
	f) specification									
	g) mutability									
8) Do you think that the lectures are too slow paced, too fast paced, about right?								?		
		Too slow	1	2	3	4	5	Too fast		
9) Do you think that the problem sets are too short, too long, about right?										
		Too short	1	2	3	4	5	Too long
